Equilibrium neutron-to-proton ratio
equilibrium n/p = exp(-Q/T)
temperature T [MeV]
Q = 1.293 MeV
Identity, not a prediction
$Y_p = 2x/(1 + x)$ if all neutrons enter ^{4}He
n/p at the onset of nucleosynthesis (INPUT)
computed baryon-to-photon ratio
η = 6.125e-10
for $\Omega_b h^2$ = 0.0224
